LATE FOREIGN DEVELOPMENTS

GERMANY: The meat ration for the normal consumer has been cut by 100 grams (3.527 ounces) weekly per person after May 31, i.e., from 350 to 250 grams, or 50 grams less than last summer. As a result of the severe winter of 1941-42, which caused Germany to experience an umprecedented loss of grains, oleaginous plants, and potatoes, 2 million metric tons (92 million bushels) of barley reserved for feeding livestock had to be used for bread for human consumption. Further reduction of livestock, especially hogs, resulted, and the meat ration was increased by 50 grams in October, but the ration has now been reduced in order to avoid further liquidation of cattle and hogs. The reduction in the meat ration has been compensated by an extra 12.5 grams of fats and 87.5 grams of bread weekly from May 31 to June 27.

CANADA'S INTENTIONS TO PLANT SHOW LARGE SHIFT FROM WHEAT TO FEED-GRAIN ACREAGE

A further sharp decline in Canada's wheat acreage is indicated by the April 30 survey of farmers' intentions to plant as reported by the Dominion Bureau of Statistics on May 10. The total wheat area for 1943 is placed at 17,087,100 acres, which is 21 percent below the 1942 acreage and slightly below the announced goal. There is little change in the planned area in summer-fallow, the prospective 1943 estimate being 20,637,000 acres as compared with 19,979,000 acres in 1942. The bulk of the acreage shift would thus be, as planned, from wheat to coarse grains and flaxseed.

The barley acreage is currently estimated at 8,087,100 acres, an increase of 16 percent, compared with that of 1942, and is the largest area ever devoted to that crop in Canada. The intended sowings of oats represent an increase of 13 percent over those of last year. While shifts are more pronounced in the Prairie Provinces, a Provincial survey of the intentions shows that farmers in all parts of the country are making an effort to increase their feed-grain production to conform to the objectives announced in the early winter.

From reports of the Dominion Bureau of Statistics.

a/ Intentions to plant as of April 30. b/ Not reported separately.

The total Canadian wheat area in 1943, based on farmers intentions to plant spring wheat, is indicated to be about 4,500,000 acres below last year's harvested acreage. The rye area shows a reduction of 540,000 acres, or a decrease of around 5,040,000 acres for the two grains. With barley and

oats together accounting for an increase of 2,860,000 acres and flaxsed, summer-fallow, and mixed grains increased approximately 1,690,000 acres, about 490,000 acres of the cultivated area remain unreported. It is assumed that the unaccounted-for area represents increases in other crops such as hay, grass, etc.

Since the intentions figures are only tentative, however, and as considerable interest in Canadian wheat has been shown recently, later estimates may disclose a somewhat larger wheat acreage than the official indications now suggest. The crop reports of the Canadian National and of the Canadian Pacific Railways forecast that wheat acreage will be considerably above the goals set or the intentions figures reported. One estimate places the total wheat area at 19,145,000 acres, or about 2,060,000 acres more than that reported in the intentions to plant.

A net area of 601,000 acres of winter wheat in Ontario remains to be harvested in 1943 indicating winter-kill of 15 percent, compared with 4 percent last year. Winter wheat harvested last year was reported at 757,000 acres. The condition of the crop was placed at 83 percent of normal on April 30, compared with 102 percent on that date of 1942. Winter rye for harvest is reported at 571,000 acres or about 56 percent of last year's harvested area of 1,014,000 acres. Total rye acreage would, on this basis, be about 125,000 acres below the goal that was announced early in the winter. Rye condition at the end of April was reported at 91 percent of normal.

Hay and clover winter-kill during the past winter was greater for Canada than in the preceding year. This year the percentage killed was placed at 7 percent, compared with 3 percent in 1941-42. Though increased for the country as a whole, the Prairie Provinces report less winter-kill than in the preceding season.

Spring wheat seeding in the Prairie Provinces was reported to be ahead of that accomplished by April 30, 1942, 18 percent having been completed, as compared with 15 percent in 1942. In Manitoba and Saskatchewan spring seeding was far advanced, but in Alberta the spring was late and little seeding had been accomplished. In Ontario and British Columbia the spring was also much later than usual, and only 4 percent of the spring wheat had been seeded in the former Province and 34 percent in the latter. Seedings of oats and barley were also below those of last year except in Manitoba and Sakskatchewan.

In order to encourage the shift from wheat to coarse grains and flaxseed in the Prairie Provinces, the wheat acreage-reduction program there has been continued. The intended wheat area for 1943 in the three Provinces was announced as 16,320,000 acres as compared with the 1942 total of 20,653,000 acres. The reduction is indicated to be 14 percent in Manitoba, 20 percent in Saskatchewan, and 25 percent in Alberta. The flaxseed increase in these Provinces is set at 1,025,000 acres.

Spring threshing is reported to be making good progress in Alberta and Saskatchewan. The condition of the grain that wintered in the fields is reported as generally good, but some deterioration both in quality and yield of the grain has been noted.

NEW ZEALAND WHEAT PRODUCTION ABOVE AVERAGE; INCREASED ACREAGE PLANNED FOR NEXT CROP. . .

The New Zealand wheat crop for 1942-43, which was harvested in January-February, is estimated at from 9,500,000 to 10,500,000 bushels, according to a report from the American Legation at Wellington. At this level, the outturn is about a million bushels above the 1941-42 production and is a near-record crop, exceeded only once since 1921. Yields per acre are indicated to be from 32 to 35 bushels from the 300,000 acres sown. The acreage falls short of the goal which had been set at 350,000 acres.

The acreage goal for the next wheat crop is also set at 350,000 acres, which would be the largest area sown since 1921 and should, assuming average yields, provide increased supplies and out down dependence on imports. The average annual consumption is estimated at 8,900,000 bushels and imports over a period of years have averaged between 1,000,000 and 2,000,000 bushels.

Maintenance of large wheat reserves is an announced governmental policy, and these stocks are widely scattered on both the North and the South Islands. Imports of wheat, which were entirely from Australia, during the first 9 months of 1942 were reported at 2,000,000 bushels. The imports were presumably to further augment reserve stocks, since the domestic production was about adequate for average requirements and large stocks were reported to have been carried over at the beginning of the 1941-42 crop year.

Expansion to 350,000 acres in wheat would involve changing from sheep farming in many instances. The manpower shortage is reported as one of the main factors handicapping acreage expansion. The Minister of Supply has assured growers that cooperation will be given them in solving labor problems in connection with the program. Some doubt is reported, however, concerning adequacy of labor supplies, since agriculture had not, at the time of the latest report, been classified as an essential industry.

The current wheat prices were fixed about a year ago at 6s.4-1/2d. per bushel f.o.b. the nearest port (about \$1.03 in terms of United States currency). This was a slight increase from the former rate of 6s.2-1/2d. (\$1.01) per bushel.

VEGETABLE OILS AND OILSEEDS

PERUVIAN COTTONSEED PRODUCTION BELOW AVERAGE . . .

Peruvian cottonseed production in 1942, amounting to 131,000 short tons, was about 2 percent below that of the preceding year, although the area planted to cotton was 10 percent smaller. This is the second year in succession that Peru's cottonseed supply has been reduced, and, as a result, the Government restricted shipments of seed from the 1941 and 1942 crops and in January 1943 adopted a resolution prohibiting exports of cottonseed. It is expected that this measure will avoid an increase in local prices and keep cottonseed mills operating.

PERU: Cottonseed production, 1933 - 1942

a/Revised. b/ Proliminary. The final estimate is not issued until August or September of the following year.

Approximately 60,000 short tons of cottonseed cake were produced in both 1941 and 1942 compared with 55,000 tons in 1940. Exports of cake dropped from 46,000 tons in 1939 to 2,500 in 1941, while none were recorded for 1942. The closing of European markets, especially Denmark and Germany, accounts for the heavy reduction in this trade. Cottonseed-oil shipments from Peru remained at low levels during 1940 and 1941, and in 1942 were completely stopped.

American Embassy, Lima. a/Quintal of 101.4 pounds.

Imports of both animal fats and vegetable fats and oils were larger in 1942 than in 1941, conspicuously so in the case of pure hog lard and butter. Olive-oil imports in 1942 were almost double the volume reported the year before but were still 47 percent below 1940 imports. Arrivals of peanut and sesame oils in 1942 were only 83 percent of those of 1941 but more than double 1940 imports. Pure hog lard jumped from 465 short tons in 1940 to 3,823 tons in 1942. Pure butter imports also increased during the 3 years, while arrivals of margarine were negligible.

COTTON - OTHER FIBERS

PLAN COMPLETED FOR HANDLING MOROCCAN COTTON CROP . . .

The 1942-43 cotton crop of Morocce will be handled under an agreement with terms much the same as those in effect for the preceding crop. The first agreement was made in February 1942 between the Moroccan Cotton Cooperative and French spinners. It provided for the purchase of the five succeeding cotton crops by the manufacturers at a price equal to ten times the state-fixed price of French soft wheat of 1939 quality. For any cotton remaining from the 1940 and 1941 crops, a premium of 20 percent was added. The agreement, however, was effective for only the 1941-42 crop, due to the Allied occupation late in 1942.

The new agreement, which was entered into by the Cotton Cooperative and Protectorate Authorities for the Government of Morocco, provides for Government purchase of the 1942-43 and the 1943-44 crops. The price for these crops will be based on the fixed prices of Algerian soft wheat. An advance of 65 percent of the estimated value of the crop will be made by the state to cotton growers, the remainder to be paid when the amount of production finally has been definitely determined.

Government encouragement to cotton growers has been given not only by the advance payments but also by incentive payments and by the placing of cloth at the disposal of growers. A bonus of 1,500 to 3,500 francs will be paid for each hectare of land (\$3.00 to \$7.00 an acre) planted to cotton in compliance with certain prescribed rules intended to insure careful cultivation and a good quality of product. In addition, each farmer may buy cotton cloth in amount up to 5 percent in weight of the cotton fiber he produces.

Sowing of the new cotton crop is now in process, and the total acreage is expected to fulfill the agreement for 4,000 hectares (9,900 acres) under cultivation, or approximately double the area planted last year. Cotton is normally produced in two districts of Morocco about equal in area, the Gharb in northwestern Morocco and the Tadla farther south at the foot of the Atlas Mountains. Moroccan cotton is said to compare well with good qualities of Egyptian cotton, but improvement is still desired.

A Cotton Institute of North Africa has been organized recently with headquarters at Rabat near the Gharb cotton district. It will work in cooperation with Algeria and Tunisia for improvement of the Pima 67, which is an American-Egyptian variety and almost the only one grown in North Africa. In particular, it is hoped to improve the characteristic of early maturity to permit the completion of picking before the autumn rains begin.

LIVESTOCK AND ANIMAL PRODUCTS

CANADA NEEDS STRICTEST CONSUMER RATIONING IN ORDER TO MEET BACON COMMITMENTS TO THE UNITED KINGDOM . . .

Canadian hog farmers have doubled production since the war began. Despite their utmost efforts, however, bacon commitments to the United Kingdom can be met only through the strictest economy of domestic consumers.

Even if the average weight of export-bacon hogs continues at around 160 pounds, the Bacon Board will require another 3.3 million hogs to complete the current year's contract for 675 million pounds to be delivered by October 31. These 3.3 million will probably represent all the hogs likely to pass through inspected plants during the next 6 months, despite the strict control of slaughterings that has been imposed. The average warm dressed weight of bacon-hog carcasses slaughtered in exporting plants since February 1 this year was 6 pounds heavier than during the same period of 1942, and from 10 to 12 pounds heavier than in the corresponding period of 1941.

Meat rationing at 2 pounds weekly per person is expected to go into effect about May 24, and it is believed that beef will form the larger share of the ration. Obviously, domestic pork supplies will be limited to uninspected slaughter and the output of other nonexporting plants plus the carcasses and portions of carcasses not suitable for export.

Since September 14, 1942, packer deliveries for domestic consumption have been reduced to 50 percent of the weekly average in 1940. On March 1, 1943, restrictions on deliveries for local consumption were applied also to farmers and local butchers in towns of more than 5,000 population throughout most of Canada, but on the basis of 75 percent of their 1941 slaughterings for sale. The restrictions do not apply to unexportable products such as heads and trimmings.

Effective January 1, 1943, all slaughterers of hogs were obliged to apply for licenses in order to bring more of the total slaughter under control. This order does not apply, however, to farmers dressing meat for consumption on their own farms.

During the first 22 weeks of the current British-Canadian bacon contract period, November 1, 1942, to April 3, 1943, only 11.8 million pounds of bacon per week have been obtained for export. If the contract is to be completed by mid-November this year, 13.9 million pounds per week will have to be produced for export in the remainder of the period.

The fall pig crop, which is now being marketed, was 16 percent larger than the year before. It is doubtful, however, whether inspected slaughterings this spring and summer will be correspondingly larger than a year ago, owing to the increase in unreported slaughter. The 21-percent increase in the spring pig crop will be reflected in heavier slaughterings next fall and winter. A year ago inspected slaughterings fluctuated from 715,000 in November down to 352,000 in August. This year a peak of 681,000 was reached in December and a low of 400,000 to 450,000 may be expected next August. Thereafter, inspected slaughtering should rise rapidly to a peak of possibly 850,000 by next November or December. This estimate assumes that the diversion of hogs from inspected slaughter will have been completely checked by that time.

Other methods adopted by the Canadian Government from time to time for the purpose of securing enough bacon to fill the British Contract follow:

- 1. Since July 23, 1941, the exportation of live hogs and pork products to countries other than Britain and British possessions has been prohibited.
- 2. Feed supplies have been conserved by the orders of July 15, July 31, and August 25, 1941, which made exports subject to licenses for (a) mill feeds, (b) concentrates, and (c) feed grains. For a long time these permits were sparingly issued.
- 3. Feed prices have been kept down since October 1941, even to the extent of subsidizing wheat sold for feed after the basic wheat price was increased last year.
- 4. Feeding to heavier weights has been encouraged, beginning in April 1942, by the discontinuance of the discount of \$1.50 per head on grade B-3 hogs dressing 176 to 185 pounds as compared with the basic price of grade B-1 hogs dressing at 135 to 175 pounds. The Bacon Board also began paying as much for 70- to 75-pound sides as for those weighing 65 to 70 pounds.
- 5. Higher prices paid, with each new contract, for bacon produced for the British market.

HIGH PRICES OF MEAT IN SOUTH AFRICA
CAUSE FARMERS TO SELL EWES FOR SLAUGHTER . . .

South African farmers are being cautioned against sending large numbers of breeding ewes to abattoirs. Prices of slaughter stock are exceptionally high because of keen demand for meat, and farmers are tempted to sell as many of their animals as possible to take advantage of these prices. It is customary to cull sheep flocks annually of older and inferior quality ewes, but this year considerable numbers of young breeding ewes are being offered for sale as slaughter stock.

The selling of good breeding stock this year should be discouraged, since large numbers already have been lost in the dry winter (June-August) of 1942 and in the subsequent cold and rainy months of September and October. If, in addition, large numbers of breeding stock are now sold for slaughter, the position may soon become critical. After the drought of 1933 it required about 8 years to restore sheep numbers to the pre-drought level.

Farmers were advised to decide on the normal carrying capacity of their farms before deciding to market ewes for slaughter. Three courses were recommended for maintaining normal numbers:

- 1. If the farm already is carrying the optimum number, the safest policy is to maintain that number and replace the older ewes by young ewes of better quality.
- 2. If the numbers are below normal carrying capacity, it is believed safest and most economical in the long run to continue breeding until normal capacity has been reached.
- 3. Only if the farm is over-grazed should surplus breeding stock be liquidated. Despite favorable wool prices, it is declared to be an unwise policy to keep too many sheep. This results in over grazing, which, if continued for a few successive years, results in such serious damage to the vegetal covering of the veldt that it sometimes requires a lifetime or more to restore it and even then only at considerable expense. For these farmers, this is the opportunity to dispose of surplus stock at profitable prices.

Some downward revision may be necessary in the original estimate for 1942-43, which placed wool production at 260 million pounds, or approximately the same as in 1941-42. Production in the 5 preceding years averaged 252 million pounds compared with the record production of 319 million pounds in 1932-33, before the disastrous drought.

The fall (March-May) or short wool clip this season is expected to be unusually small. The British Purchasing Commission's guaranteed prices encourage farmers to allow wool to grow to longer lengths rather than to market the shorter wools, as in normal times, in order to take advantage of changing market conditions.

South African wool for the duration of the war has been purchased by the United Kingdom and is handled by the British Purchasing Commission. As South Africa is one of the three most important producers of fine wool, Australia and the United States being the other two, most of the wool is being shipped to the United Kingdom. In normal times continental Europe, especially Germany, took a large share of this wool.

Shipments to the United States reached record proportions last season, as the Defense Supplies Corporation was building up a strategic stockpile. Shipments to the United States for the first 10 months of the current season through April, however, were much smaller and totaled only 27 million pounds, according to declarations at consulates, a reduction of 63 percent compared with a year earlier. A little over 81 percent of the wool shipped through January of the preceding season (1941-42) was to the account of the Defense Supplies Corporation. Later estimates are not available.

CHILE LOOKS TO THE UNITED STATES
TO ABSORB LARGE WOOL SURPLUS. . .

Chile has a large surplus of wool for export this year, and the hope of producers and exporters is that the United States will be able to absorb it. The wool consists chiefly of fine fleeces from the Magallanes region.

Production in the current year is estimated at between 36 and 37 million pounds. In addition, a surplus of 2 million pounds was carried over from the preceding clip. When the quantity needed for domestic consumption is deducted, the exportable surplus will be about 27 million pounds.

Exports last season were the smallest in many years, totaling only 17 million pounds compared with an average of 24 million pounds for the prededing 5 years. The decrease may be accounted for largely by the fact that the United Kingdom did not enter the market for the first time in the history of the country. The usual continental European markets were closed on account of the war, neutral Switzerland being the only market outside the Western Hemisphere to purchase Chilean wool in 1942.

The United States took 14 million pounds of Chilean wool last year. Despite the purchase of this relatively large amount, a substantial carry-over resulted because of the absence of other foreign buyers. In 1941 the United Kingdom and Japan together took 22 million pounds, or 87 percent of total exports. In the pre-war years the United Kingdom and Germany were the chief support of this market.

A plan for United States purchase, similar to that agreed upon for the disposal of the Uruguayan surplus, is favored by Chilean producers. Meanwhile, the largest sheep-ranching company in Chile has undertaken to make arrangements for shipping 10 million pounds of wool to the United States to be placed on consignment at Boston, at their own expense. Small producers, however, are not able to finance such shipments and are faced with growing stocks of wool from the present clip to be added to the carry-over from last year.

PERUVIAN WARTIME WOOL PROBLEM EASED . . .

The problem of disposing of the unusually large stocks of Peruvian wool carried over from the 1942 clip was eased materially when the Minister of Finance was notified in February that the United States would admit 2 million pounds of high grade wool (sheep's) to be shipped either in United States or Peruvian vessels.

The wool outlook for 1943 is now more encouraging from the standpoint of growers and exporters, because most of the wool stocks suitable for United States requirements that were still warehoused in southern Peru at the beginning of March 1943 have been sold. The remaining stocks are largely of carpet-type wools not usable in the United States for military or essential civilian needs.

Flocks are reported to be in good condition, and prospects for the current clip (1943) are good. Wool is shorn principally during the months

Jan . . . -

January-April in Peru, although some of the larger ranches shear under cover in November. Most of the exports take place during the calendar year.

Production last year is tentatively estimated at 18.5 million pounds, although some estimates place it as low as 15 million pounds. The estimate of the Junta Nacional de la Industria Lanar (National Wool Board), which is the official source of wool estimates, is not yet available. This Board bases production estimates on exports and domestic consumption. Although exports were unusually small in 1942, domestic mill consumption is reported to have increased, and reported carry-over stocks were unusually large. It is believed that unreported stocks were also large.

Wool exports in 1942 totaled only 1,970,000 pounds, grease and scoured combined, a decrease of 74 percent compared with the unusually large exports of 1941 and 63 percent below the average for the 5 years 1936-1940. Exports in 1940 and 1941 were chiefly to the United States, although in 1941 Japan entered the market and took 483,000 pounds. Exports from Peru in normal pre-war years were mainly to Germany and the United Kingdom.

Note: Except as otherwise noted, all trade figures in this publication are compiled from publications and official records of the Bureau of the Census.

Official figures for the total value of agricultural products, for the months of December, January, February, and March are not now available but will be published at a later date.

Until further notice, no analysis of United States foreign trade in agricultural products will accompany the tables published in the monthly foreign-trade supplement of Foreign Crops and Markets.

a/ Based on 74 classifications. b/ Based on 122 classifications.

c/ Supplementary agricultural imports consist of all imports similar to agricultural commodities produced commercially in the United States, together with all other agricultural imports interchangeable to any significant extent with such United States commodities. Complementary agricultural imports include all others, about 95 percent of which consist of rubber, coffee, raw silk, cacao beans, wool for carpets, bananas, tea, and spices.
